

HAVING Statement

- It's a statement that allows us to filter the data that has already been aggregated

```
SELECT column1,  
        agg-func(column) AS description  
FROM table-name  
GROUP BY column1  
HAVING Condition;
```

- Having statement allows us to filter data that is grouped

Example

employees			
Id	Name	depart	Salary
101	Mark	HR	10
102	Steve	HR	20
103	Jeff	IT	30
104	Elon	IT	15
105	Rafhi	CEO	100

Write an SQL query to calculate the total salary paid per department.

You GROUP BY a column that is not aggregated in your SELECT statement (categorical column)

department	total-salary
HR	30
IT	45
CEO	100

↓
Grouped data

Write an SQL query to show me the departments that get a salary allocation of more than 40.

```
SELECT department,  
SUM(salary) AS Total-S  
FROM employees  
GROUP BY department  
HAVING Total-S > 40;
```

↓ output

Department	Total-S
IT	45
CEO	100

WHERE STATEMENT - filters row data.

HAVING Statement - filters grouped data or aggregated data

for you to use a having statement you need to first aggregate your data and group it to a specific category then

Table: salaries .
employee_id name department salary

```
SELECT department ,  
       SUM(salary) AS Total-Salary,  
       SUM(Bonus) AS Total-bonus  
FROM salaries  
GROUP BY department;
```

↓ output

department	Total-Salary	Total-bonus
IT	122000	10500
HR	109000	7500
finance	70000	6000
