

Structured Query Language
SQL Syntax; This is just how we write a code in SQL

SELECT is a function in SQL that allows us to select specific columns in our data

• Select Statement allows us to select the columns

	Col1	Col2	Col3	
Row1				The table name.
Row2				
Row3				

FROM Statement - Is a function in SQL that allows you to specify the name of the table you are selecting from output.

SELECT col1,
col2, →
col3,
FROM table-name;

Col1	Col2	Col3

Select * → it allows you to select all the columns from a table without having to specify them one by one.

Syntax

SELECT *
FROM table-name

illustrative example

Student-table

Student-id	Name	Subject	Marks
101	Izofhiwa	Maths	99
102	Mbali	Maths	20
103	Sipho	Physics	60
104	Dumi	Geo	85

SELECT Name,
Subject,
FROM student-table;

Name	Subject
1	.

→ We separate Column names with a comma within a Select statement.

(;) The semi-colon is a closing Statement.

→ Shows that the script ends here

SELECT DISTINCT

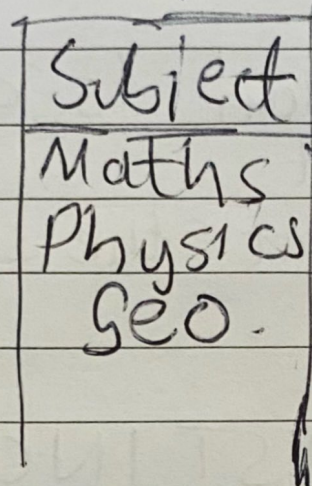

→ Is a way to select different values in a specific column

→ It Removes duplication

→ Does not repeat the same Value

Student-id	Name	Subject	Marks
		Maths	99
		Maths	20
	Mboal,	Physics	60
	Sipho	Geo	85
	Tumi		

```
SELECT DISTINCT Subject  
From student-table;
```

Subject
Maths
Physics
Geo.

This are distinct values

Filtering (Data filtering)
WHERE Statement

→ Is a filtering statement.

→ it allows us to filter our data based on specific conditions

→ It affects the rows not the columns.

→ You filter rows based on a condition applied into a column.

```
SELECT col1,  
        col2,  
        col3
```

```
FROM table-name  
WHERE condition;
```

where
