Machine learning Process

→ The outcome of a Machine learning Process is an AI tool or AI system.

→ In order to build a Machine learning Model - we need data

The Role of the data engineer is to make the data available in the data-warehouse or database

Builds data pipelines to store the data in the data warehouse

② Stake Holder: Defines the problem.

Before building AI/ML Solution we need to define the problem we are trying to.

(E.g)

Bank:

↳ Predict the 'likelihood of a customer leaving my bank and going to another

Goal → we want to retain our customers

I want to create a machine learning Model.
③ Explore and Understand the data)

(To predict the customers likely to churn.

↳ Exploratory data Analysis (EDA)

You analyze the data to understand patterns, trends, and Relationships

Asking data driven questions?

↳ which Customers are leaving
↳ does age affect churn

↳ Do Customers with many complains leave

Preparing data for machine learning

feature building

Converting text into numbers (Encoding)

- Scaling numeric values
- Creating new useful columns
- Splitting data into feature & target

Feature Engineering

Feature Selection

⑤ Split the Data (Train Test split)

Training data → used to teach the Model (80%)

Testing data → used to check if the Model works (20%)

⑥ Choose machine learning algorithm.
